

UNIVERSITY OF KERALA

Syllabus for

M.Sc Degree Program in Physics with specialization in Space Physics

(With effect from 2020 admissions)

UNIVERSITY OF KERALA

M. Sc Degree Program in Physics (Space Physics)

Objectives: Major objective of the M. Sc Physics program of University of Kerala is to equip the students for pursuing higher studies and employment in any branches of Physics and related areas. The program also envisages developing thorough and in-depth knowledge in Mathematical Physics, Classical Mechanics, Quantum Mechanics, Statistical Physics, Electromagnetic Theory, Nuclear Physics, Atomic and Molecular Spectroscopy and Electronics. The program also aims to enhance problem solving skills of students so that they will be well equipped to tackle national level competitive exams. The program also acts as a bridge between theoretical knowhow and its implementation in experimental scenario. Since the specialization of this program is space physics it covers basic ideas of atmospheric physics, solar physics and elements of cosmology. The program also introduces the students to the scientific research approach in defining problems, execution through analytical methods, systematic presentation of results keeping in line with the research ethics through M. Sc dissertations.

Program Outcome

- (i) Define and explain fundamental ideas and mathematical formalism of theoretical and applied physics.
- (ii) Identify, classify and extrapolate the physical concepts and related mathematical methods to formulate and solve real physical problems.
- (iii) Identify and solve interdisciplinary problems that require simultaneous implementation of concepts from different branches of physics and other related areas.
- (iv) To define and explain fundamental ideas of space physics and astrophysics.
- (v) To define a research problem, translate ideas into working models, interpret the data collected draw the conclusions and report scientific data in the form of dissertation.
- (vi) To disseminate scientific knowledge and scientific temper in the society to contribute towards greater human cause.

UNIVERSITY OF KERALA
M.Sc Physics (with specialization in Space Physics) Degree Program
(Effective from 2020 admissions)

B: SPECIAL PAPERS FOR THIRD AND FOURTH SEMESTERS

Sl. No	Special paper Category	Code Nos of	Name of Special Papers
1	SPACE PHYSICS	PHS 234 PHS 242 PHS 243 PHS 244	Physics of the Atmosphere Space Physics Introduction to Astrophysics Lab: Space Physics

C: GENERAL GUIDELINES

C-1 Theory papers

Books of study and corresponding chapters are given for most of the theory papers in the syllabus to define the scope of the syllabus.

For internal evaluation of theory papers at least one Viva must be conducted for each paper

For assignments and seminars current developments in the areas of the syllabus may be chosen for improving the general awareness of the student

In tutorial sessions of theory papers problem solving in different topics of the syllabus may be discussed.

C-2 Lab Courses

Rough records may be properly maintained for each practical paper and should be produced during the University Practical Examinations along with original record book.

Each student is encouraged to include critical comments on each experiment done in the original records including sources and estimates of errors, limitations in the experiments done and scope for improvements/additions in the experimental work.

In performing Electronics Practicals: Bread Board Practice is recommended in addition to soldering of electronic circuits.

C3-Project work and Project Evaluation

The project work should be carried out in the area of space physics and related areas only. The project may be started during the third semester of the M.Sc programme. 25 marks of the project are to be awarded on the basis of internal assessment carried out in the College for each student concerned. A Project rough record may be maintained by each student to help to evaluate the progress of the project. Each student is required to present the completed project along with experimental demonstration if any in the college before the final University examinations in the Fourth Semester of the MSc (Physics) Programme.

For University Examinations for the Project: 50 marks is allotted for Project report evaluation and 25 marks allotted for Project based Viva Voce to be conducted along with General Viva Voce examination by the University.

D Pattern of University Question papers D-1

Theory Papers

Each question Paper has three parts: Part A, Part B and Part C

Part A: Eight short answer questions covering the entire syllabus. *One of the questions from this section may be used to test the CURRENT AWARENESS (general knowledge) of the student in the areas of syllabus covered for this paper.* Each question carries 3 marks.

Part B: contains three compulsory questions with internal choice. Questions cover all the three units in the syllabus. Each question carries 15 marks.

Part C: contains six problems covering the entire syllabus. The student needs to answer any three. Each question carries five marks.

The question paper pattern for the theory papers is given separately.

D-2 PRACTICALS

Each practical paper carries a total of 75 marks. 10 marks are allotted for practical records.

PH 251 General Physics Practicals (6h): Section A (45 marks) and Section B (20 marks)

PH 252: Electronics and Computer Science (6h): Unit A-Electronics practical (45 marks)

Unit B- Computer Science (20 marks)

PHS 244 Lab: space Physics (5h): (65 marks)

PHS 245 Project: Internal Evaluation for project is 25 marks

For University Examinations: 50 marks for Project Dissertation/report evaluation and 25 marks for Project based Viva Voce

PHS 246 General Viva Voce: For General Viva Voce covering the entire MSc Syllabus,

University Examinations: 100 marks

(University Question Paper pattern given separately)

PH 2xy.....

Duration: 3 hours

Maximum marks: 75

Instructions to question paper setter

1. Each question paper has three parts - Part A, Part B and Part C
2. Part A contains eight short answer questions spanning the entire syllabus, of which the candidate has to answer any *five* question carries *three* marks.
3. Part B contains *three* compulsory questions with internal choice. Each question shall be drawn from each unit of the syllabus. Each question carries 15 marks
4. Part C contains six problems spanning the entire syllabus. The candidate has to answer any *three*. Each question carries *five* marks

PART A

(Answer any five questions. Each question carries three marks)

- 1.
- 2.
- 3.
- 4
- 5.
- 6.
- 7.

PH 211: CLASSICAL MECHANICS (6L, 1T)

Objectives: This course is aimed to provide basic and advanced concepts in classical mechanics. The course discusses Lagrangian and Hamiltonian formalisms, central force problems, theory of small oscillations, Hamilton -Jacobi equations, Kepler's problem, Rigid body dynamics and Euler's equations, Concepts of special and general theory of relativity, Non linear dynamical systems and chaos.

Unit I

Lagrangian Mechanics (12 hours)

Mechanics of a particle and system of particles- constraints- D'Alemberts principle and Lagrange's equations-simple applications of Lagrangian formulation-Hamilton's principle-techniques of calculus of variations-derivation of Lagrange's equations from Hamilton's principle-conservation theorems and symmetry properties

Two body central force problem (14 hours)

Reduction to one body problem-equations of motion-equivalent one dimensional problem-differential equation for the orbit in the case of integrable power law potentials- Virial theorem- Kepler's problem-inverse square law of force-scattering in central force field-transformation of the scattering problem to laboratory coordinates

Theory of small oscillations (10 hours)

Equilibrium and potential energy-theory of small oscillations-normal modes- two coupled pendula- longitudinal vibrations of carbon dioxide molecule

Unit II

Hamiltonian Mechanics (12 hours)

Generalised momentum and cyclic coordinates-conservation theorems-Hamilton's equations-examples in Hamiltonian dynamics (harmonic oscillator, motion of a particle in a central force field, charged particle in an electromagnetic field, compound pendulum)- canonical transformations-generating functions- poisson brackets- Liouville's theorem

Hamilton-Jacobi equations (10 hours)

Hamilton-Jacobi equation-harmonic oscillator as an example-separation of variables in

Hamilton-Jacobi equation-action angle variables-Kepler's problem

Rigid body dynamics (14 hours)

Generalised coordinates of rigid body-Euler's angles- infinitesimal rotations as vectors- angular momentum and inertia tensor- Euler's equations of motion of a rigid body-force free motion of symmetrical top-motion of heavy symmetrical top.

Unit III

Special and General Theory of Relativity (16 hours)

Postulates of special theory- four-vectors and tensors- relativistic particle dynamics- Lorentz transformations -relativistic Lagrangian- mass-energy equivalence- covariant Lagrangian, Relativistic Lagrangian, Mass energy equivalence.

General theory of relativity principle of equivalence applications - ideas of Riemannian geometry-space time curvature geodesics -Einstein's equations of General theory of relativity, Observational evidence to general theory of relativity.

Introduction to non-linear dynamics (12 hours)

Linear and nonlinear systems-integration of second order non-linear differential equations- pendulum equation-phase plane analysis of dynamical systems-linear stability analysis-limit cycles

Elements of classical chaos (10 hours)

Bifurcation- logistic map-strange attractors- Lyapunov exponent and Chaos-ideas of fractals- solitary waves- Kdv equations and solutions

Course Outcome

- (i) Students are able to learn the concepts of Lagrangian and Hamiltonian mechanics and use them to solve problems in mechanics. Able to learn concepts of generating functions, Poisson brackets Hamilton Jacobi equations and action angle variables.
- (ii) To equip the students to deal with central force problem and analyzing Kepler's laws.
- (iii) To inculcate the students the concepts of special and general theory of relativity and related problems.
- (iv) To acquaint the students about the theory of small oscillations and Euler's equations of motions of rigid bodies.

- (v) To analyze nonlinear dynamical systems and to explain the concepts of classical chaos.

Books for study

PH 212: Mathematical Physics (6L, 1T)

Objectives: This course is aimed to equip the students with the mathematical techniques used for developing strong back ground in the basic and advanced level problems. The course describes about curvilinear coordinates, Fourier series and transforms, probability distributions, partial differential equations and different integral transforms, special functions, tensors and group theory.

Unit I

Vector analysis and matrices (8 hours)

Review of vector analysis-vector calculus operators-orthogonal curvilinear coordinates-gradient, divergence, curl, Laplacian in cylindrical and spherical polar coordinates-orthogonal and unitary matrices- Hermitian matrices- diagonalization of matrices- normal matrices- Cayley-Hamilton theorem

Complex analysis (8 hours)

Cauchy-Riemann conditions-Cauchy's integral theorem and formula-singularities and mapping-calculus of residues-dispersion relations

Fourier series and applications (8 hours)

General principles of Fourier series, Complex representation, Parseval's identity, Fourier's Integrals, Fourier transforms and its properties.

Probability (12 hours)

Definitions and simple properties of probability-random variables- Chebychev inequality and moment generating function-discrete and continuous probability distributions-binomial distributions- poisson distributions- Gauss Normal distribution-error analysis and least square fitting-chi-square and student 't' distributions

Unit II

Differential equations (16 hours)

Partial differential equations-first order equations-separation of variables-singular points-series solutions and Frobenius method- non-homogeneous partial differential equations-Green's functions-Laplace transforms and inverse Laplace transforms-applications to solution of simple differential equations

Special functions (20 hours)

Bessel functions of the first kind-orthogonality-Neumann functions-Hankel functions-modified Bessel functions-spherical Bessel functions-Legendre functions-generating

function-recurrence relations and orthogonality-associated Legendre functions-spherical harmonics-Hermite functions-Laguerre functions-Chebyshev polynomials-hypergeometric functions

Unit III

Tensor analysis (18 hours)

Notations and conventions in tensor analysis-Einstein's summation convention-covariant and contravariant and mixed tensors-algebraic operations in tensors-symmetric and skew symmetric tensors-tensor calculus- Christoffel symbols-kinematics in Riemann space-Riemann- Christoffel tensor.

Group theory (18 hours)

Definitions of a group-elementary properties-sub groups-homomorphism and isomorphism of groups-representation of groups-reducible and irreducible representations-simple applications in crystallography and molecular symmetry- Lie groups- SU(2) groups and their representations

Course Outcome

- (i) To apply and analyze the various vector and matrix operations and to perform complex analysis for solving physical problems.
- (ii) To demonstrate and utilize the concepts of Fourier series and its transforms.
- (iii) To explain and differentiate different probabilistic distributions.
- (iv) To apply partial differential equations and special functions for solving mathematical problems.
- (v) To illustrate and apply concepts of group theoretical operations and tensors.

PH 213: BASIC ELECTRONICS (6L,1T)

Objectives: This course is aimed to introduce the students with the basic knowledge of analog and digital circuits. The course illustrates the concepts of various amplifier circuits, solid state electronic devices, sequential digital circuits, optoelectronics devices and measurements using electronic instruments.

Unit I

Selections from electronic circuits (10 hours)

Frequency response of an amplifier circuits-power and voltage gain- impedance matching- Bode plots- Miller effects- rise time bandwidth relations- frequency analysis of BJT and FET amplifier stages

Operational amplifier and its applications (18 hours)

Opamp - frequency response, poles and zeroes, transfer functions (derivation not required), expression for phase angle- Active filters-first order and second order Butterworth transfer function-first order and second order active filters- low pass, high pass and band pass filters- comparators-OP Amp as a voltage comparator-zero crossing detectors-Schmitt trigger-voltage regulators- square, triangular and saw tooth wave form generators-Weinberg oscillator- monostable and astable multivibrator circuits using IC 555 timer- Phase Locked Loop circuits (PLL)

Microwave solid state electronic devices (8 hours)

Tunnel diode-varactor diode-IMPATT diode- QWITT diode- TRAPATT diode- Gunn diode

Unit II

Digital electronics

Arithmetic and data processing digital circuits (16 hours)

Binary adder and subtractor- arithmetic logic unit- binary multiplication and division- arithmetic circuits using HDL- multiplexers- demultiplexers- BCD to decimal decoder- seven segment decoder- parity generators and checkers- magnitude comparator- programmable logic arrays

Sequential digital circuits (20 hours)

Flip flops- edge triggered- SR flip flops- JK flip flop- D- flip flop- JK master-slave flip flop- different types of registers (SISO, SIPO, PISO, PIPO)- universal shift registers- applications- counter asynchronous and synchronous electronic counters- decade counters- digital clock

Unit III

Optoelectronics (22 hours)

Optical fibre as a wave guide-mode theory of circular wave guide- -modes in step index fibres- signal distortion in optical fibres- group delay, material dispersion, wave guide dispersion- sources of attenuation- absorption, scattering, bending loss, core and cladding loss- optical sources- LED's- structure, quantum efficiency and power- laser diodes- modes and threshold conditions, rate equations, efficiency and resonant frequency- photo detector- pin and avalanche photodiodes- principles- optical amplifier- basic applications and types, semiconductor optical amplifiers, erbium doped fibre amplifiers.

Electronic Instrumentation (14 hours)

Electronic measurements and instruments-comparison between analog and digital instruments- performance and dynamic characteristics-ideas of errors and measurement standards- voltmeters-ammeters- CRO- Block diagram, CRT, CRT circuits, vertical deflection system- delay line, multiple trace, horizontal deflection system, oscilloscope probes and transducers, oscilloscope techniques, storage oscilloscope, digital storage oscilloscope- classification of transducers-active and passive transducers-force and displacement transducers-strain gauges- temperature measurements-thermistors-thermocouples-flow measurements.

Course Outcome

- (i) To equip the students design and analyze different analogue and digital circuits.
- (ii) To summarize the knowledge of basic arithmetic and data processing circuits and memory devices.
- (iii) To equip the students to explain various components in optical communications systems and microwave devices.
- (iv) To measure and analyze the different electronic signals.

PH 221: MODERN OPTICS AND ELECTROMAGNETIC THEORY (6L, 1T)

Objectives: This course covers linear and non-linear optical phenomenon, propagation of electromagnetic waves, relativistic electrodynamics, radiation and antenna theory.

Unit I

Modern optics (24 hours)

Multiple beam interference-Fabry-Perot interferometer- theory of multilayer films-antireflection films and high reflectance films -Fresnel- Kirchoff integral theorem and formula- Fraunhofer and Fresnel diffraction patterns and theory-applications of Fourier transforms to diffraction- acoustic- optic modulation- basic ideas of Raman-Nath diffraction and Bragg diffraction- holography as wavefront reconstruction-propagation of light in crystals-optical activity and Faraday rotation

Non-linear optics (12 hours)

Harmonic generation- second harmonic generation- phase matching- third harmonic generation- optical mixing- paramagnetization of light- self focusing- multiquantum photoelectric effect- two photon process and theory- multiphoton processes- three photon processes- second harmonic generation- parametric generation of light.

Unit II

Electromagnetic waves (12 hours)

Electromagnetic wave equations-electromagnetic waves in non-conducting media-plane waves in vacuum-energy and momentum of electromagnetic waves-propagation through linear media- reflection and transmission at normal and oblique incidence-electromagnetic waves in conductors-modified wave equations and plane waves in conducting media-reflection and transmission at a conducting interface

Relativistic electrodynamics (14 hours)

Vector and scalar potential- gauge transformations- Coulomb gauge and Lorentz gauge-Magnetism as a relativistic phenomena- transformation of the field-electric field of a uniformly moving point charge-electrodynamics in tensor notation-electromagnetic field tensor-potential formulation of relativistic electrodynamics

Radiation (10 hours)

Dipole radiation- electric dipole radiation- magnetic dipole radiation- radiation from an arbitrary source- point charges- power radiated by a point charge- radiation reaction

Unit III

Transmission lines (12 hours)

Transmission line parameters and equations-input impedance-standing wave ratio and power- The Smith Chart-applications of transmission lines

Waveguides (12 hours)

Rectangular wave guides-transverse magnetic (TM) modes-Transverse electric (TE) modes- wave propagation in the wave guide-power transmission and attenuation

Antennas (12 hours)

Radiation from Hertzian dipole-half wave dipole antenna-quarter wave monopole antenna- antenna characteristics -antenna arrays-effective area and Friji's equations

Course Outcome

- (i) To demonstrate the linear and nonlinear optical phenomena.
- (ii) To explain and discuss propagation of electromagnetic waves through different media.
- (iii) To restate formulations and relativistic effects in electrodynamics.
- (iv) To analyse the propagation of electromagnetic waves through waveguides.
- (v) To use radiation theory in developing different antennas.

PH 222: THERMODYNAMICS, STATISTICAL PHYSICS AND BASIC QUANTUM

MECHANICS (6L, 1T)

Objectives: This course is aimed to introduce the concepts of thermodynamic equations, foundations of classical and quantum statistics, theory of phase transitions and foundations quantum mechanics together with problems.

Unit I

Thermodynamic relations and consequences (20 hours)

Thermodynamic functions and Maxwells's equations-Clausius -Claepyrans equations- Properties of thermodynamic potentials-Gibbs-Helmoltz relation-thermodynamic equilibrium-Nernst -heat theorem and its consequences-Gibb's phase rule-chemical potential-vapour pressure relation and chemical constants

Foundations of classical statistical physics (16 hours)

Phase space-ensembles-Lioville's theorem-statistical equilibrium-microcanonical ensemble-partition functions and thermodynamic quantities-Gibb's paradox-Maxwell-Boltzmann distribution laws-grand canonical ensemble

Unit II

Quantum statistics (26 hours)

Quantum statistics of classical particles-density matrix in microcaonical, canonical and grand canonical ensembles-Bose Einstein statistics and Bose Einstein distribution law-Maxwell Boltzmann statistics and Maxwell Boltzmann distribution law—Fermi Dirac statistics and Fermi Dirac distribution law-comparison of three types of statistics-applications of quantum statistics-Planck radiation laws-Bose Einstein gas and Bose Einstein condensation—Fermi Dirac gas-electron gas in metals-thermionic emission-statistical theory of white dwarfs

Phase transitions (10 hours)

Triple point-Vanderwal's equation and phase transitions-first and second order phase transitions- Ehrenfest's equations- Ising model

Unit III

Foundations of quantum mechanics (14 hours)

Basic postulates of quantum mechanics- Hilbert's space- observables- Hermitian operators- general statistical interpretation- Uncertainty principle- minimum uncertainty wave packet- energy time uncertainty principle- Dirac notation- Matrix representation of state vectors and operators- change of representations- eigenvalue problem in matrix mechanics- energy and momentum representations- unitary transformations involving time- Schrodinger, Heisenberg and interaction pictures.

Exactly solvable problems in quantum mechanics (22 hours)

One dimensional eigen value problems- square well potential- potential barrier- alpha particle emission- Bloch waves in periodic potential- linear harmonic oscillator problem using wave mechanics and operator methods- free particle wave functions and solutions- three dimensional eigen value problems- particle moving in spherical symmetric potential- rigid rotator- hydrogen atom problem- three dimensional potential well- Deuteron

Course Outcome

- (i) To explain the basic thermodynamic relations, Maxwell's equations and its consequences.
- (ii) To equip the students to demonstrate and apply classical and quantum statistics in different physical phenomena.
- (iii) To distinguish the different phase transitions using Ising model.
- (iv) Outline and apply foundations of quantum mechanics.

PH 223: COMPUTER SCIENCE AND NUMERICAL TECHNIQUES (6L, 1T)

Objectives: This course provides introduction to computer architecture, microprocessors, programming in python and C++ and computational numerical methods.

Unit I

Foundations of computer science (12 hours)

Introduction to computers-computer architecture-memory (RAM and ROM, cache) and storage- I/O devices- operating systems-data communications, computer networks and topology

Introduction to microprocessors (12 hours)

Evolution of microprocessors-microcontrollers and digital signal processors- Intel 8085 8 bit microprocessor- pin description-functional description- 8085 instruction format-addressing modes of 8085- interrupts of 8085- memory interfacing- 8085 machine cycles and Bus timings- assembly language programming of 8085

Introduction to Python Programming (12 hours)

Python - Python shell, number, variables, comparisons and logic, Python objects - strings, lists, tuples, loops; control flow, file input and output functions

Unit II

Programming with C++ (36 hours)

C++- flow control-conditional statements-iterative statements-switch statements-conditional operators as an alternative to IF-nested loops-break statements-ext() functions-structured data types-arrays-storage classes-multidimensional arrays-sorting of strings-functions-built in and user defined- accessing function and passing arguments to functions-calling functions with arrays-scope rule for functions and variables-structures in C++-classes and objects – definition- class declaration-class function definitions-creating objects-use of pointers in the place of arrays-file handling in C++-basic file operations-serial and sequential files-reading and writing on to disks.

Unit III

Numerical Techniques (36 hours)

Solution of simultaneous linear algebraic equations-Gauss elimination method-Gauss

Jordan method-inverse of a matrix using Gauss elimination method-Finite differences-forward and backward differences-central differences-difference of a polynomial-error propagation in difference table-Interpolation with equal intervals-Gregory Newton forward and backward formula- error in polynomial interpolation-central difference interpolation formula-Gauss's forward and backward formula- Stirling's formula-Lagrange interpolation formula-numerical differentiation-numerical integration using general quadrature formula-Trapezoidal rule- Simpsons 1/3 and 1/8 rules-numerical solutions to ordinary differential equations-Euler and modified Euler methods-Runge Kutta methods-numerical solution to partial differential equations-solutions to Poisson and Laplace equations.

Course Outcome

- (i) To summarize computer hardware and its operating systems
- (ii) Explain internal architecture of microprocessors 8085 and create assembly language programming.
- (iii) To develop and compile programs in python and C++.
- (iv) Apply numerical methods to solve physical problems.

PH231: ADVANCED QUANTUM MECHANICS (6 L, 1 T)

Objectives: This course describes a thorough conceptual understanding of advanced quantum mechanics covering variation method, WKB approximation, perturbation theory, symmetry and conservation laws, theory of scattering, system of identical particles, angular momentum and relativistic quantum mechanics.

Unit I

Variation method (6 hours)

The variational principle-Rayleigh Ritz method-variation method for excited states-ground state of Helium and Deuteron.

WKB approximation (8 hours)

WKB method-connection formulas-barrier potential-penetration-alpha particle emission-bound states in a potential well

Time dependent and time-independent perturbation theory (22 hours)

Time independent perturbation- basic concepts- non-degenerate energy levels- anharmonic oscillator- ground state of helium- effect of electric field on the ground state of hydrogen-degenerate energy levels- effect of electric field on the $n=2$ state of hydrogen- spin-orbit interaction.

Time dependent perturbation- first order, harmonic, transition to continuous states, absorption and emission of radiation- Einstein's coefficients- selection rules.

Unit II

Symmetry and conservation laws (10 hours)

Symmetry transformations-space translation and conservation of angular momentum-time translation and conservation of energy-rotation in space and conservation of angular momentum-space inversion-time reversal

Quantum theory of scattering (12 hours)

Scattering cross section and scattering amplitude-partial wave analysis and scattering by a central potential-scattering by attractive square well potential-scattering length-expression for phase shifts-Born approximation-scattering by Coulomb potential-Laboratory and centre of mass coordinate transformations.

System of identical particles (14 hours)

Identical particles- Pauli's exclusion principle-inclusion of spin-spin function for a two electron system-Helium atom-central field approximation-Thomas Fermi model of an atom-Hartree and Hartree-Fock equations.

Unit III

Angular momentum (12 hours)

Angular momentum in operators and commutation relations-eigen values and eigen

functions of L^2 and L_z –general angular momentum-eigen values of J^2 and J_z -angular momentum matrices-spin angular momentum –spin vectors for a spin $\frac{1}{2}$ system-addition of angular momentum-Clebsch-Gordan coefficients.

Relativistic quantum mechanics (24 hours)

Klein-Gordon equations and its relevance-particle in a Coulomb's field-Dirac's relativistic theory-Dirac's equation for a free particle-Dirac matrices-covariant form of Dirac's equations-probability density-plane wave solutions-negative energy states-spin in Dirac's theory-magnetic moment of an electron-relativistic corrections of Hydrogen atom spectrum-spin orbit correction-Lamb shift

Course Outcome

- (i) To extend the use of approximation methods viz variation, WKB, time dependent and time independent perturbations.
- (ii) To summarize different types of symmetry, conservation laws and quantum theory of scattering.
- (iii) To distinguish different approximation methods, to study the structure and properties of many electron systems.
- (iv) To compute eigen values of angular momentum and evaluation of CG coefficients.
- (v) Infer the requirements of relativistic quantum mechanics.

Book for study

1. G.Aruldas,*Quantum Mechanics*, Second Edition, PHI learning Pvt Ltd (2009)
2. D.J.Griffiths,*Introduction to Quantum Mechanics*, Second Edition, Pearson Education Inc (2005)
3. J.J.Sakurai,*Advanced Quantum Mechanics*, Pearson Education Inc (2009).

PH 232: ATOMIC AND MOLECULAR SPECTROSCOPY (6L, 1T)

Objectives: This course provides an overview of symmetry of molecules, concepts of atomic spectra, Photoelectron and photo acoustic spectroscopy, Rotational, vibrational, electronic, Raman, Mossbauer, nuclear and electron spin resonance spectroscopic techniques.

Unit I

Atomic Spectroscopy (14 hours)

Spectra of Atoms - Spectroscopic terms- selection rules- exchange symmetry of wave functions- Pauli's exclusion principle. Many electron atoms- Building principle- the spectra of Li and hydrogen like elements, The L-S and j-j coupling schemes- total angular momentum - term symbols- The spectra of Helium-Zeeman effect - The magnetic moment of atom, Lande's g factor- The normal Zeeman effect- Emitted frequencies in anomalous Zeeman transitions- Nuclear spin and Hyperfine structure, Stark Effect, Paschen Bach effect

Molecular symmetry (10 hours)

Symmetry operations-symmetry elements-algebra of symmetry operations-multiplication tables-matrix representation of symmetry operators-molecular point groups-reducible and irreducible representations-great orthogonality theorem-character tables for C_{2v} and C_{3v} point groups, symmetry species of point groups-IR and Raman activity

Photoelectron and Photo-acoustic spectroscopy (12 hours)

Photoelectron spectroscopy-experimental methods-photoelectron spectra and their interpretation-Auger electron and X ray Fluorescence spectroscopy-Photo-acoustic effect-basic theory-experimental arrangement-applications.

Unit II

Molecular rotational spectroscopy (12 hours)

Classification of molecules-rotational spectra of diatomic molecules-isotope effect and intensity of rotational lines-non rigid rotator-linear polyatomic molecules-symmetric and asymmetric top molecules-microwave spectrometer-analysis of rotational spectra.

IR spectroscopy (12 hours)

Vibrational spectra of diatomic molecules-characteristic IR spectra-vibrations of polyatomic molecules- anharmonicity- Fermi resonance-hydrogen bonding-normal modes of vibration in a crystal- interpretation of vibrational spectra- IR spectrometer-Fourier transform IR spectroscopy

Electronic spectra of molecules (12 hours)

Vibrational coarse structure and analysis of bound systems- Deslanders table-Frank-Condon principle-vibrational electronic spectra-rotational fine structure- Fortrat parabola-electronic angular momentum in diatomic molecules

Unit III

Raman spectroscopy (12 hours)

Theory of Raman scattering-rotational and vibrational Raman spectra-Raman spectrometer-structure determination using Raman and IR spectroscopy-nonlinear Raman effects-Hyper Raman effect- stimulated Raman scattering- coherent anti-stokes Raman scattering

ESR and NMR spectroscopy (16 hours)

Principle of NMR-ESR spectrometer-Hyperfine structure-ESR spectra of Free radicals-Magnetic properties of nuclei-resonance condition-NMR instrumentation-chemical shift-NMR spectra of solids-NMR imaging-interpretation of NMR spectra

Mossbauer spectroscopy (8 hours)

Recoilless emission and absorption-Mossbauer spectrometer-experimental techniques-isomer shift- quadrupole interaction-magnetic hyperfine interaction

Course Outcome

- (i) Explain different symmetry operations and deduction of molecular structure.
- (ii) Distinguish and classify the different spectra shown by atoms and molecules
- (iii) Illustrate the various spectroscopic experimental techniques.

Books for study

1. J.M. Hollas, *Modern Spectroscopy*, Fourth Edition, John Wiley & Sons (2004)
2. G. Aruldas, *Molecular Structure and Spectroscopy*, PHI learning Pvt Ltd (2007)
3. Suresh Chandra, *Molecular Spectroscopy*, Narosa Publishing Co (2009)
4. H E White, *Introduction to Atomic Spectroscopy* McGraw-Hill Inc. 1st Edition.

(1934).

3. J.L.McHale, Molecular Spectroscopy, Pearson education Inc (2008).

PH 233: CONDENSED MATTER PHYSICS (6L, 1T)

Objectives: To understand and familiarize fundamentals of crystals, lattice vibrations, band theory, dielectric, magnetic and superconducting properties of materials. To introduce the synthesis and characterization techniques of nanomaterials.

Unit I

Crystal physics (10 hours)

Lattice points and space lattice-basis and crystal structure-unit cells and lattice parameters-symmetry elements in crystals –space groups-Bravais lattice-density and lattice constant relation-crystal directions, planes and Miller indices-reciprocal lattice-allotropy and polymorphism in crystals-imperfections in crystals.

Lattice vibrations and thermal properties (10 hours)

Dynamics of identical atoms in crystal lattice-dynamics of linear chain-experimental measurement of dispersion relation-anharmonicity and thermal expansion-specific heat of solids-classical model-Einstein's model-Debye model-thermal conductivity of solids-role of electrons and phonons-thermal resistance of solids.

Free electron and band theory (16 hours)

Electrons moving in one dimensional potential well-Fermi-Dirac statistics-effect of temperature on Fermi distribution-electronic specific heat-electrical conductivity of metals-Wiedmann- Franz- Lorentz law-electrical resistivity of metals-Hall effect-energy bands in solids-Kronig- Penny model-construction of Brillouin zones-nearly free electron model-conductors, semiconductors and insulators-elementary ideas of Fermi surfaces

Unit II

Semiconductors (12 hours)

Free carrier concentration in semiconductors-mobility of charge carriers-temperature effects- electrical conductivity of semiconductors-Hall effect in semiconductors - semiconductor junction properties.

Dielectric and magnetic properties of materials (24 hours)

Dipole moment-polarisation-local electric field in an atom-dielectric constant and its measurement-polarizability-classical theory-Peizo, Pyro and Ferro electric properties of Crystals-Ferroelectric domains-classification of magnetic materials-atomic theory of magnetism- Langevin's theory-paramagnetism and quantum theory-Weiss molecular exchange field-ferromagnetic domains-anti ferromagnetism-Ferrites.

Unit III

Superconductivity (20 hours)

Experimental attributes to superconductivity-critical temperature, critical current and critical magnetic field of superconductors-effects of magnetic field on superconductors-Type I and II superconductors-intermediate and vortex states-thermal conductivity, specific heat and energy gap in superconductors-microwave and IR properties-coherence length-Theories of superconductivity-London equations-Ginzberg-Landau theory-BCS theory-AC and DC Josephson effects in superconductors- Examples and properties of High Temperature Superconductors.

Introduction to nano science and technology (16 hours)

Introduction to nanomaterials, properties, classification of nanomaterials, quantum confinement effects, Density of states-nano material preparation techniques-sputtering-chemical vapor deposition-pulsed laser deposition-sol-gel technique-characterization of nano materials-X-Ray diffraction- Scanning Probe Microscopy-atomic force microscopy-SEM and TEM techniques-carbon nano structures-elements of nano electronics.

Course Outcome

- (i) Discuss crystal physics, lattice vibrations, models of thermal properties and band theory of solids.
- (ii) Explain the theoretical concepts of semiconductors, dielectric, magnetic and superconducting materials.
- (iii) To describe the synthesis and characterization techniques of nanomaterials.
- (iv) To apply the concepts in condensed matter physics to meet the challenges.

PHS 234: PHYSICS OF THE ATMOSPHERE (7L,1T)

Objectives: The aim of this course is to explore the evolution and composition of Earth's atmosphere. The course includes the information on Earth's interior, role of various components in climate, thermodynamics of atmospheric phenomenon, atmospheric boundary layer and its regional variations, various properties of aerosols and classification of clouds.

Unit I

Earth's Atmosphere (42 hours)

Introduction to Atmospheric Science (12 hours)

Overview and scope, Evolution and History, Basic definition (qualitative only) Co-ordinate system for atmospheric studies, Optical properties, Mass, Chemical composition, Vertical structure, Winds, Precipitation, **The Earth System and its components** – Oceans, Cryosphere, Terrestrial Biosphere, Crust and Mantle, Roles of Various Components in Climate-The Hydrologic Cycle, Carbon Cycle- Carbon in atmosphere, biosphere, oceans and Earth's crust (qualitative only),

Atmospheric Thermodynamics (14 hours)

Dalton's law of partial pressures, Virtual Temperature, The Hydrostatic Equation, Geopotential, Scale Height and the Hypsometric Equation, Thickness and Heights of Constant Pressure Surfaces, Reduction of Pressure to Sea Level, Concept of an Air Parcel, The Dry Adiabatic Lapse Rate, Potential Temperature, Water Vapour in Air and Moisture Parameters, Saturated Adiabatic and Pseudo adiabatic Processes, The Saturated Adiabatic Lapse Rate, Equivalent Potential Temperature and Wet-Bulb Potential Temperature, Normand's Rule, Net Effects of Ascent Followed by Descent, Static Stability, Unsaturated Air, Saturated Air, Conditional and Convective Instability

Atmospheric Boundary Layer (6 hours)

Atmospheric boundary layer -Turbulence, Eddies and Thermals, Vertical Structure, Temperature, Humidity, Winds (qualitative only) Day-to-Day and Regional Variations in Boundary-Layer structure

Aerosols and Clouds (8 hours)

Physical, chemical and optical properties of Aerosols, Cloud classification, microphysics of clouds, aerosol – cloud interaction, Radiative transfer in aerosols and clouds, Roles of aerosols and clouds in atmosphere

Unit II

Radiative Transfer and Atmospheric Dynamics (42 hours)

Radiative Transfer (18 hours)

Preliminary concepts of radiation, (qualitative only) The Greenhouse Effect, Physics of Scattering and Absorption and Emission (qualitative only), Scattering by Air Molecules and Particles, Absorption by Particles, Absorption and Emission by Gas Molecules, Radiative Transfer in Planetary Atmospheres, Beer's Law, Reflection and Absorption by a Layer of the Atmosphere, Absorption and Emission of Infrared Radiation in Cloud-Free Air, Vertical Profiles of Radiative Heating Rate, Radiation Balance at the Top of the Atmosphere

Atmospheric Dynamics (18 hours)

Kinematics of the Large-Scale Horizontal Flow, Elementary Kinematic Properties of the Flow, Vorticity and Divergence, Deformation, Streamlines versus Trajectories, Dynamics of Horizontal Flow, (qualitative only) Apparent Forces, Real Forces, The Horizontal Equation of Motion, The Geostrophic Wind, The Effect of Friction, The Gradient Wind, The Thermal Wind, Primitive Equations, Pressure as a Vertical Coordinate, Hydrostatic Balance, The Thermodynamic Energy Equation, Inference of the Vertical Motion Field, The Atmospheric General Circulation, Brewer-Dobson Circulation,

Atmospheric Waves and oscillations (6 hours)

Description of wave propagation, acoustics waves, buoyancy waves, gravity waves, Kelvin and Rossby waves, Quasi Biennial Oscillation

Unit III

Observations and Modelling of Weather and Climate (42 hours)

Atmospheric Observations (14 hours)

Automatic weather stations for in situ measurements of temperature, pressure, humidity and wind, Atmospheric RADARS, LIDAR, SODAR, Radiometers, Satellite Remote Sensing of atmospheric parameters

Climate Dynamics (14 hours)

The Present-Day Climate, Annual Mean Conditions, Dependence on Time of Day, Seasonal Dependence, Climate Variability, Internally Generated Climate Variability, Externally Forced Climate Variability, Climate Monitoring and Prediction

Atmospheric Modelling (14 hours)

Hierarchy of numerical models: Filtering problem, barotropic model; equivalent barotropic model; two level Baroclinic model; general circulation model, Parameterization of physical processes in the atmosphere: Basic concepts of parameterization - boundary layer, cumulus convection, radiation and land surface processes, Numerical weather prediction models, Regional and Global climate models, chemical transport model. (qualitative only)

Topics for Assignments

Brief History of Climate and the Earth system, Formation and Evolution of the Earth System, The Atmosphere as a Heat Engine and Passive remote sensing by satellites.

Course Outcome

- (i) Discuss the composition of Earth's atmosphere.
- (ii) Apply hydrostatic equation to study variation of atmospheric pressure with height.
- (iii) Explain atmospheric boundary layers.
- (iv) Discuss various properties of aerosols.
- (v) Classify different types of clouds.

Books for Study

1. Atmospheric Science An Introductory Survey, John Wallace and Peter V. Hobbs, Elsevier, Second Edition.
2. Physics of the atmosphere and climate, Murry L Salby, Cambridge University Press

3. An Introduction to Atmospheric Thermodynamics by A.A. Tsonis , Cambridge University Press.
4. Physics of the Cloud by B.J. Mason, Oxford University Press
5. Microphysics of cloud and Precipitation by Pruppacher and Klett, Springer
6. Atmospheric Chemistry and Physics: From Air Pollution to Climate Change by John H. Seinfeld, Spyros N. Pandis, Wiley.

PH 241: NUCLEAR AND PARTICLE PHYSICS (6L, 1T)

Objectives: To familiarize the fundamental properties of nucleus, its structure, models, nuclear reactions, nuclear detectors and accelerators. To introduce the concept of elementary particles and their interactions.

Unit I (36 hours)

Nuclear forces (10 hours)

Deuteron-neutron –proton scattering and proton-proton scattering at low energies-non central forces- nuclear exchange force-meson theory of nuclear forces

Nuclear models (12 hours)

Detailed studies on liquid drop, shell and collective models of the nuclei.

Nuclear reactions (14 hours)

Conservation laws-energetic nuclear reactions-Q value equation-partial wave analysis of nuclear reaction cross section- compound nuclear hypothesis-resonance reactions-Brot-Wigner one level formula-optical model-theory of stripping reactions.

Unit II (36 hours)

Nuclear Fission (20 hours)

Mechanism of nuclear fission-calculation of critical energy based on liquid drop model-fission products and energy release-fission chain reactions-neutron cycle and four factor formula-general features and classification of nuclear fission reactors.

Nuclear Fusion (16 hours)

Nuclear fusion in stellar interiors-proton-proton reactions-carbon-nitrogen cycle-thermo nuclear reactions in the laboratory-conditions for the construction of nuclear fusion reactor-critical ignition temperature-Lawson criterion-plasma confinement in fusion- principles of pinch, magnetic and inertial confinements.

Unit III (36 hours)

Nuclear detectors and particle accelerators (20 hours)

Gas filled detectors-ionization chamber and proportional counters-GM counter-scintillation detectors-semiconductor detectors- Cerenkov detector-bubble chamber. Particle accelerators- electrostatic accelerators-cyclotron accelerators-synchrotrons-linear accelerators-colliding beam accelerators.

Elementary particle physics (16 hours)

Elementary particle interactions-symmetries and conservation laws-quark model of elementary particles-colored quarks and gluons-ideas of charm, beauty and truth-quark dynamics-ideas of grand unified theories of fundamental forces

Course Outcome

- (i) To describe and analyze nuclear structure, models and reactions.
- (ii) To illustrate the mechanisms of nuclear fission and fusion reactions.
- (iii) Discuss various nuclear detectors and particle accelerators.
- (iv) To classify elementary particles and discuss their interactions.

Books for Study

- 1 D.C. Tayal, *Nuclear Physics*, 5th Edition, Himalaya Publishing Co (2008)
- 2 J. Verma, R.C.Bhandari, D.R.S.Somayajulu, *Fundamentals of Nuclear Physics*, CBS Publishers and Distributors (2005).
3. K.S. Krane, *Introductory Nuclear Physics*, Wiley India Pvt. Ltd (1988)

References

- 1 S.B. Patel, *Nuclear Physics-An Introduction*, New Age International Pvt. Ltd (1996).

3. S.N. Ghoshal, *Nuclear Physics*, S. Chand Ltd (1997)
4. M.P. Khanna, *Introduction to Particle Physics*, PHI (2011)
5. J. Freidberg, *Plasma Physics and Fusion Energy*, Cambridge University Press (2007)
6. FF.Chen, *Introduction to Plasma Physics*, Springer, London (2002)

PHS 242 SPACE PHYSICS (5L,1T)

Objectives: The aim of this course is to explore the physical processes, which occur in the space environment. The course will provide information on basic plasma phenomena, plasma waves, magnetohydrodynamics, Sun, solar wind, cosmic rays and solar energetic particles, neutral atmosphere, ionosphere, magnetosphere and experimental technique for radiation environment.

UNIT 1

Physics of Plasmas (30 hours)

Introduction to Plasma (15 hours)

What is a plasma?, Gaseous plasma Quasi-neutrality, Collisions of charged particles, Plasma oscillations, Non-classical plasmas, **Dynamics of a charged particle:** The key role of the magnetic field, Basic charge motion in constant and uniform fields, Non-uniform magnetic field, Adiabatic invariants

Elements of plasma kinetics: The Vlasov Model, Heuristic Derivation of the Vlasov Equation, Properties of the Vlasov Equation, Relation between the Vlasov Equation and Fluid Models, Mobility and Drift Velocity, **Stochastic processes in a plasma:** The velocity distributions, moments of distribution functions, Collisions and Transport, Electrical Conductivity, Diffusion, Motion in Magnetic Fields in the presence of collisions

Elements of magnetohydrodynamics (7 hours)

Introduction to magnetohydrodynamics, Magnetic Pressure, Diamagnetic Drift, The Generalized Ohm's Law, Diffusion of a Magnetic Field, The Frozen-in Magnetic Flux, Alfvén Waves

Plasma Waves and Dusty Plasma (8 hours)

Maxwell's Equations and the Wave Equation: Basic Concepts, Phase Velocity, Wave Packet and Group Velocity, Refractive Index, The General Dispersion Relation, Plasma instabilities, **Dusty Plasma:** Introduction to Dusty Plasma, Presence of plasma in nature, Generation of plasma, application and modeling

UNIT 2

Sun and space environment (30 hours)

The Sun (10 hours)

Sun the primary driver of solar system and life on earth, Basic solar properties, historical understanding, Source of Sun's energy, Nuclear reactions in the solar core, Black Body Radiation and the solar spectrum, **Transport of Energy from core and Modelling the solar interior:** Convective instability, Convective energy transfer, The quiet photosphere, **Around the Sun:** The solar disc & Sunspots, magnetic fields, Solar rotation and the solar cycle chromosphere and corona

Solar magnetism (12 hours)

Elements of dynamo theory & Solar kinematic dynamos, Concentrating and expelling the magnetic field, Lorentz force restriction on dynamo action, Basic physics of magnetic flux tubes, Surface magnetic field & Basic large-scale magnetic field, Parker's spiral & Basic heliospheric current sheet, Observed large-scale structure, **Connecting the Sun and the solar wind:** Origin of solar wind, Magnetic field effects on the wind, Three-dimensional structure & Warped heliospheric current sheet, Various sources of fast and slow winds

Solar observations and methods (8 hours)

Observations of Sun and its interior from ground, Satellite based observations of Sun, Challenges and Technology, Modeling of Sun and Community models for solar processes.

Unit 3 Terrestrial Upper Atmosphere & Sun –Earth Interactions

Geomagnetism and Terrestrial Upper atmosphere (8 hours)

Introduction to Earth's magnetic Field, Elements of earth's magnetic field, Difference between geographic and geomagnetic coordinates , **The Terrestrial Upper Atmosphere:** Diffusion, Molecular Diffusion, Eddy Diffusion, Diffusive Equilibrium, Maximum Diffusion Velocities, Thermal Structure, Thermosphere, The Exosphere , Modeling Thermosphere through MSIS, Community Models

The Ionosphere (9 hours)

Solar radiation and production of ionization, Ionization Profile, Ion Composition and Chemistry, The D Region, The E Region, The F Region, Gyration-Dominated Plasma Transport, Ambipolar Electric Field and Diffusion, Diffusive Equilibrium in the F2 Region, Sq Current and the Equatorial Electrojet , Modeling ionosphere using IRI, Bent, and Ionospheric conductivity and density models, **Some Concepts of Atmospheric Chemistry :** Thermodynamics, Chemical Kinetics, Atmospheric Composition and Chemistry, Mesosphere , Thermosphere and Ionosphere

The Terrestrial Magnetosphere (13 hours)

Interaction of the Solar Wind with the Terrestrial Magnetic Field, The Bow Shock and the Magnetopause, The Magnetospheric Cavity, Magnetospheric Current Systems, The Ring Current , Field-Aligned Currents, Plasma Convection in the Magnetosphere, The Axford-Hines and the Dungey Models, Magnetic Diffusion & Magnetic Reconnection, Convection Electric Field & High-Latitude Electrodynamics, Polar Cap Convection for Southward IMF and Ionospheric Convection Velocities, Aurorae, Space Weather, Magnetic Activity and Substorms, Magnetic Storms, Geomagnetic Activity Indices, Importance and applications of Space Weather.

Course Outcome

- (i) Calculate fundamental properties of a plasma with given appropriate information.
- (v) Apply basic electromagnetism to derive the kinetic theory of plasmas
- (vi) Explain Sun's interior structure, physics of solar wind and origin of cosmic rays.
- (vii) Explain the main consequences of magnetic reconnection for Earth's magnetosphere.
- (viii) Demonstrate the experimental technique for ionospheric studies.

PHS 243: INTRODUCTION TO ASTROPHYSICS (5L,1T)

Objectives: The aim of this course is to get basic information of celestial coordinate system, basic nomenclature in astronomy. The course describes energy generation phenomenon in stars, hydrostatic equilibrium stars, evolution of different types of stars, components of milkyway, morphological classification of galaxies and evolution of universe.

UNIT 1

NIGHT SKY AND MEASUREMENT OF LIGHT (30 HOURS)

Understanding the Night Sky: Concept of celestial sphere; Celestial coordinate systems - altitude - right ascension-declination; Celestial time keeping – ecliptic and path of the Sun in the sky, rising and setting of stars in the sky, equinoxes and solstices.

Measurement of Light: Basic terms in astronomy - flux, luminosity, specific flux, specific luminosity, bolometric luminosity, inverse square law of light, apparent magnitude, absolute magnitude and the magnitude system, trigonometric parallax as a means to measure distances to nearby stars, definition of a light year, definition of a parsec, apparent magnitude – absolute magnitude – distance relation; Signals from Astronomical Sources - Electromagnetic frequencies and photon energies, the Earth's atmosphere and transparency to electromagnetic radiation; Telescopes (qualitative only) - optical telescopes, radio telescopes, X-ray telescopes, space based observatories with Hubble Space Telescope as an example, its advantages over ground-based telescopes.

Introduction to Stars: Stars as blackbody - Blackbody radiation - Planck's theory of black body radiation - Planck function - Rayleigh-Jeans and Wien approximations - Stefan-Boltzmann equation connecting stellar luminosity, radius, and surface temperature; Spectral classification of stars - absorption and emission spectra - description of how they are produced - understanding stellar

spectra through Boltzmann equation - Saha equation of thermal ionization - Harvard system of classifying stars based on their spectra - spectral classes of stars and luminosity classes of stars.

UNIT 2 STARS (30 HOURS)

Introduction to Stars : Stars as blackbody - Blackbody radiation - Planck's theory of black body radiation - Planck function - Rayleigh-Jeans and Wien approximations - Stefan-Boltzmann equation connecting stellar luminosity, radius, and surface temperature; Spectral classification of stars - absorption and emission spectra - description of how they are produced - understanding stellar spectra through Boltzmann equation - Saha equation of thermal ionization - Harvard system of classifying stars based on their spectra - spectral classes of stars and luminosity classes of stars.

Interstellar Medium and Formation of Stars: phases of the interstellar medium - their physical properties - distribution within the Galaxy; HII regions and Stromgen sphere - sizes of Stromgen sphere around stars of various spectral type; Interstellar dust composition - its distribution within the Galaxy - extinction and reddening of star light due to dust; Virial theorem - Jeans criterion for gravitational collapse - free-fall time scale as time-scale for star formation.

Stellar Nucleosynthesis: Energy generation mechanism in stars - nuclear fusion - mass defect - p-p chain - CNO cycle - energy generated from pp chain and CNO cycle; Energy transport within stars (conduction, convection, radiation) - time-scale for energy transport within stars - Nuclear time scale.

Stellar Evolution: Hydrostatic equilibrium in stars - pressure equation of state; The Hertzsprung – Russell diagram, and the concept of main sequence; Post main-sequence evolution (qualitative) - He burning, and subsequent stages of nuclear burning in stars; Evolution of low mass stars – electron degeneracy pressure - white dwarfs – planetary nebulae; Evolution of high mass stars – supernova – neutron degeneracy pressure - neutron star – black holes, and Schwarzschild radius.

UNIT 3 GALAXIES AND COSMOLOGY (30 HOURS)

Milky Way Galaxy: The components of the Milky Way (qualitative based on observational evidence) – the Galactic Disk (young thin disk, old thin disk, thick disk, scale height, the distribution of stars and interstellar gas) - Galactic bulge - stellar halo - underlying stellar populations – size and shape of the Galaxy; Open star clusters and Globular star clusters - Kinematics of the Galaxy – differential rotation - rotation curve of the Galaxy – evidence for Dark Matter Halo; Galactic center – observational evidences for the presence of Super Massive Black Hole in the Galactic center.

Galaxies in our Universe: Distances to the nearest galaxies; Morphological classification of galaxies – the Hubble tuning fork - trends in the Hubble sequence of galaxies based on color, stellar populations, gas fractions, dust, and star formation rates from spectra; Galaxy groups and galaxy clusters - Mass and size scales of groups and clusters – the Local Group galaxies (qualitative) - velocity dispersion measures of galaxies in clusters, virialization, comparison of luminous mass of galaxy clusters with dynamical mass, and the evidence for Dark Matter.

Cosmology and the Evolution of the Universe: Expansion of the Universe based on observations of redshifts of galaxies - redshift expression in terms of wavelength and recession velocity - Hubble's constant - Hubble time as a value for the age of the universe - scale factor – the concept of metric - cosmological redshift as due to expansion of space; Friedman equation based on Newtonian cosmology, critical density and density parameter, open, closed and flat universes;

Cosmic Microwave Background (qualitative) - observations and the origin of the CMB, evidence for Dark Energy.

Course Outcome

- (i) Discuss different celestial coordinate systems.
- (ii) Apply Stefan – Boltzmann equation to get stellar luminosity.
- (iii) Explain different phases of interstellar medium.
- (iv) Discuss energy generation in stars.
- (v) Classify different types of galaxies and discuss evolution of Universe.

Books for study

1. Baidyanath Basu, Tanuka Chattopadhyay, Sudhindra Nath Biswas - An Introduction to Astrophysics - Prentice Hall India Learning Private Limited, 2010/2013
2. Bradley W. Carroll, and Dale A. Ostlie: Introduction to Modern Astrophysics, Addison Wesley (II Edition), 1997 – or – Pearson 2006
3. Arnab Rai Choudhuri – Astrophysics for Physicists, Cambridge University Press, 2010
4. Hannu Karttunen, Pekka Kröger, Heikki Oja - Fundamental Astronomy - Springer 2007

PH 251: GENERAL PHYSICS PRACTICALS

Objectives: Demonstrate and understand various general physics experiments for acquiring fundamental concepts.

(Total of 12 experiments to be done from Section A and B)

Section A (*atleast 6 experiments to be done in this section*)

1. Determination of elastic constants by Cornu's method (elliptical and hyperbolic fringes)
2. Analysis of absorption spectra of liquids using spectrometer
3. Determination of e/k using Ge and Si transistors
5. Anderson Bridge –determination of self and mutual inductance
6. Michelson Interferometer experiments
7. Identification of Fraunhofer lines in solar spectra
8. Verification of Richardson's equation using diode valve
9. Thermal diffusivity of brass
10. e/m of an electron-Thompson's method
11. Charge of an electron-Millikan's method
12. Determination of Fermi energy of Copper
13. Study of variation of resistance of a semiconductor with temperature and determination of band gap
14. Magnetic Susceptibility of a liquid using Quincke's method
15. Ferromagnetic studies using Guoy's method
16. Hall effect in a semiconductor
17. Thermo-emf of bulk samples like Al, Cu. Brass etc.
18. Zeeman effect using Fabry-Perot Interferometer.

Section B (at least 6 experiments to be done from this section)

1. BH curve-anchor ring
2. Study of photoelectric effect and determination of Planck's constant
3. Determination of Stefan's constant
4. Experiments using Laser:
 - (a) Laser beam characteristics
 - (b) Diffraction grating
 - (c) Diffraction at different types of slits and apertures
 - (d) refractive index of liquids
 - (e) particle size determination
5. Young's modulus of different materials using strain gauge
6. Determination of magnetic force in a current carrying conductor
7. Optical fibre characteristics – numerical aperture, attenuation and bandwidth of given specimen.
8. Cauchy's constants of liquids and liquid mixtures using hollow prism and spectrometer
9. Surface tension of a liquid using Jaeger's method.
10. Analysis of powder XRD data.
11. Study of stellar spectral classification from low dispersion stellar spectra
12. Study of HR diagram of stars
13. Radioactive material counting statistics
14. Interpretation of UV- visible spectra of materials
15. Electrical characteristics of a solar cell

Course Outcome

- (i) To measure and analyze various physical quantities.
- (ii) To calculate error in various general physics experiments.
- (iii) To develop experimental skills

PH 252 Electronics and Computer Science Practicals

Objectives: Design, construct and verify various electronics circuits and object oriented programming using C++ to solve numerical problems.

Unit I – Electronics Experiments (A total of 12 experiments to be done)

Section A (*atleast 6 experiments to be done*)

1. Single stage CE amplifier –Design and study of frequency response
2. Study of RC Phase shift oscillator circuits using Transistors
3. Construction and study of astable multivibrator and VCO circuits using Transistors
4. Study of OP Amp circuits (a) summing amplifier (b) difference amplifier
5. OP Amp as an integrator and differentiator
6. Characteristics of JFET and MOSFET
7. Characteristics of SCR
8. Design and study of negative feedback amplifier circuits
9. Study of Clipping and Clamping circuits
10. UJT Characteristics and UJT relaxation Oscillator
11. Study of active filters using OP amps (a) low pass (b) high pass (c) band pass for both first order and second order-gain/ roll off determination
12. Wave form generation using OP amp circuits: (a) astable and monostable multivibrators (b) square, triangular and saw-tooth wave generation
13. IC 555 timer experiments (a) monostable and astable multivibrators (b) VCO
14. D/A convertor circuits using OP Amp 741
15. Differential amplifier circuits using transistors
16. Design of series pass voltage regulators using transistors with load and line regulation (b) O Amp

Section B (atleast 6 experiments to be done)

1. Emitter follower and source follower circuits
2. Weinberg oscillator using OP Amp
3. SR and JK Flip Flops -construction using Logic Gates and study of truth tables
4. Study of the frequency response of a tuned amplifier
5. Study of power amplifier circuits
6. Frequency multiplier using PLL
- 7 Study of Schmitt trigger circuits using transistors
8. Construction and study of cascade amplifier circuit using transistors.
9. Digital modulation circuits (a) BFSK generation using 555 timer (b) BFSK detector using 555 timer and PLL (c) BPSK generation
10. Shift register and ring counter circuits using flip flops
11. Miscellaneous transistor applications (a) automatic night light with LDR
(a) inverter circuit (transistors as a switch) (c) time delay circuit using SCR
12. BCD to decimal decoder and seven segment display using
13. Design of Electronic counters (up and down counters)

Unit II Computer Programming

(A minimum of 8 experiments to be done, programs should be written in C++ language)

1. Least square fitting
2. First derivative of tabulated function by difference table
3. Numerical integration (Trapezoidal rule and Simpson method)
4. Solution of algebraic and transcendental equations using Newton-Ralphson method

5. Solution of algebraic equations using bisection method
 6. Numerical interpolation using Newton and Lagrangian methods
 7. Monte Carlo simulation
 8. Evaluation of Bessel and Legendre functions
 9. Matrix addition, multiplication, trace, transpose and inverse.
 10. Fourier series analysis
 11. Study of motion of projectile in a central force field
 12. Study of Planetary motion and Kepler's laws
- Course Outcome**
- (i) To design and construct various electronic circuits and its validation.
 - (ii) To calculate error in various electronics experiments.
 - (iii) To develop experimental and programming skills

PHS 244 Lab: Space Physics

Objectives: The aim of the practical lab session is to incorporate critical thinking abilities and quantitative skills of students to demonstrate knowledge, understanding and use of the principles of atmospheric science space physics and astrophysics.

Any 10 experiments from the list given below

1. Analysis of aerosols using aerosol spectrometer,
2. Aerosol properties using solar radiometer
3. Analysis of aerosols using satellite based sensors
4. Analysis surface meteorological data like temperature, pressure, wind speed, rainfall etc using Automatic Weather Station
5. Analysis of upper air data; using radiosondes, ozonesondes
6. Analysis of cloud characteristics using ground based instruments; Ceilometer (LIDAR)
7. Analysis of precipitation characteristics using disdrometer and MRR
8. Studies using Solar Spectrometer.
9. Time variations of components of geomagnetic field using magnetometer
10. Distance to the moon by Parallax
11. Characteristics of CCD camera
12. Polar Alignment of an astronomical telescope
13. Estimating relative magnitude by a group of stars by a CCD camera.
14. Experiments using photodiodes.
15. Image analysis stellar objects.
16. Any other equivalent experiment in the relevant area of specialization.

Course outcome

- (i) Ability to use reasoning and logic to define a problem in terms of principles of physics.
- (ii) Data handling skills such as making measurements with specialized equipment and computer applications.
- (iii) Ability to handle and interpret satellite data.
- (iv) Knowledge on methods and techniques of astronomical imaging using charged coupled device (CCD) detectors and computer controlled telescopes to obtain images of the moon, planets, stars and nebulae.
